(54) DATA SYNCHRONOUS PROCESSOR

(57)Abstract:

PROBLEM TO BE SOLVED: To make it possible to reduce a communication cost such as a telephone bill by transmitting/receiving data by an electronic mail at the time of transmitting/receiving information necessary for the synchronous processing of data and to inexpensively and easily construct a system by using a large part of an existing system.

SOLUTION: A data base device B 21 records and stores the history data of a data change (addition/change/deletion) as data synchronous information. The change history data to be the data synchronous information are converted into a format capable of transmitting the data by an electronic mail and a mail including data synchronous information obtained after a specified date is sent to a data base device A 12. After receiving the mail, the receiving side data base device A 12 checks whether the received mail includes the data synchronous information or not. When the received mail includes the data synchronous information, the data synchronous information is extracted from the received mail and the synchronous processing of the information is executed.
